The nervous system, composed of neurons, serves as the fundamental unit for brain function. The precise classification of distinct neuronal subtypes is therefore critical for neuroscience research. Numerous neurodegenerative diseases, including Alzheimer's disease (AD), Parkinson's disease (PD), and amyotrophic lateral sclerosis (ALS), are closely linked to the damage or dysfunction of specific neurons. Consequently, the detection of neurons and their associated biomarkers is essential for elucidating brain development, defining neuronal functions, and advancing the diagnosis and treatment of these diseases.

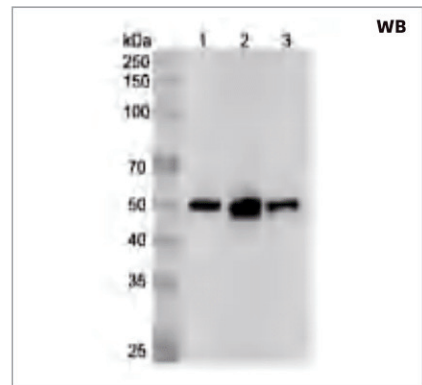

**YHE38701**

Recombinant Human SLC1A2 Protein, N-GST

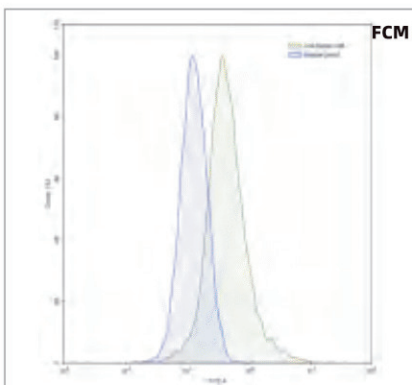

**EHB98601**

Recombinant Human APOE4 Protein, C-His

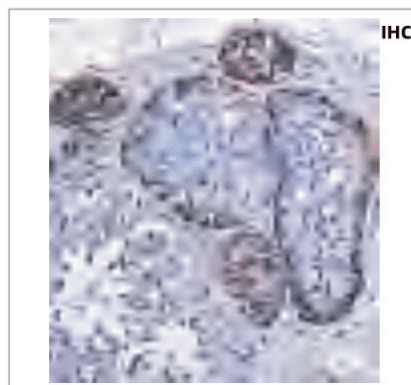

**PMC10001**

Anti-Mouse TP53/p53 Polyclonal Antibody

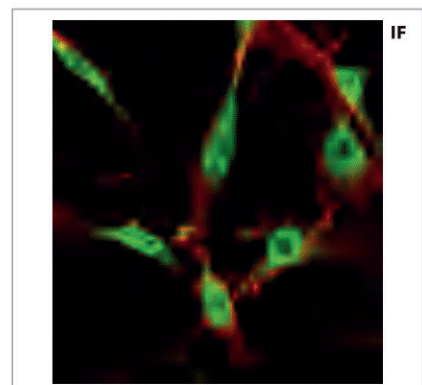

**FHC35320**

Anti-Human VIM/Vimentin Antibody (SAA0112)

**RHC08402**

Anti-S100B Antibody (R1J61)

**RHE57501**

Anti-SOX2 Antibody (R3L73)

# Neural Cell Markers

Core "Members" of the Nervous System: Neurons and Glia. The precise functioning of the nervous system relies on the coordinated collaboration between two core components: diverse subtypes of neurons and a variety of supportive glial cells. Together, they form the essential network responsible for signal transmission and functional regulation throughout the body.

# Neurodegenerative diseases

Neurodegenerative diseases encompass a heterogeneous spectrum of disorders characterized by the progressive degeneration and loss of neurons in the central or peripheral nervous system. The pathogenesis of these disorders is multifactorial, involving dysregulation of multiple pathways such as neuronal dysfunction, impaired glial cell function, protein misfolding and aggregation, oxidative stress, and neuroinflammation. These conditions represent a major global health challenge and impose a substantial burden on both human health and quality of life.

# Nervous System-related Tumors

Nervous system tumors encompass a heterogeneous group of neoplasms originating from cells of the central nervous system (brain and spinal cord) or peripheral nervous system. Their development is closely linked to the abnormal proliferation of neural stem cells, dysregulated glial/neuronal differentiation, mutations in key molecular pathways (e.g., IDH, EGFR, NF2), and a dysregulated tumor microenvironment. These tumors pose a significant health threat to individuals of all ages and are characterized by distinct histological features and invasive behaviors, making them a central focus in neuro-oncology research.

# Other common neurological disorders

Beyond neurodegenerative diseases and nervous system tumors lies a broad category of neurological disorders caused by infections, immune dysregulation, vascular abnormalities, metabolic deficits, or ion channel dysfunction. Their pathogenesis involves multiple mechanisms—such as dysregulated neural circuits, blood-brain barrier disruption, neuroinflammation, and disrupted signaling pathways—which collectively impair neurological integrity. Understanding these disorders represents a vital research direction in neuroscience.

# Phosphorylation Modification

Phosphorylation, precisely regulates the activity, localization, and interactions of proteins in the nervous system through the dynamic balance between protein kinase-mediated phosphate group transfer and phosphatase-mediated dephosphorylation. This mechanism is central to neural signal transduction, synaptic plasticity, and neuronal homeostasis. Its dysregulation is closely associated with the onset and progression of various neurological disorders, making it a key target in the field of scientific research.

## Cell Research

 **Catalog No.** RMB98601  
**Product name** Anti-Mouse APOE Antibody (HJ6.3)

Targeting necrotic lipid release in tumors enhances immunosurveillance and cancer immunotherapy of glioblastoma

## Advanced Science

**IF 14.1**

 **Catalog No.** RMB98601  
**Product name** Anti-Mouse APOE Antibody (HJ6.3)

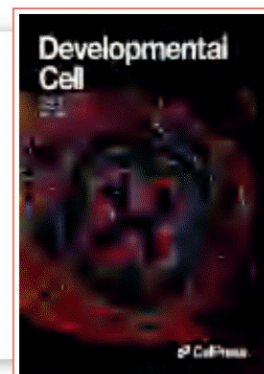

Elevated Apolipoprotein E Expression in Hippocampal Microglia Drives Temporal Lobe Epilepsy Progression

 **Catalog No.** RHB99901  
**Product name** Anti-Human CRP Nanobody (SAA1358)

Weakly ionized gold nanoparticles amplify immunoassays for ultrasensitive point-of-care sensors

**IF 10.7**

## Developmental Cell

 **Catalog No.** DHD42201  
**Product name** Research Grade Anti-Human IL11 Antibody (X203)

Targeting VSIG4+ tissue-resident macrophages enhances T cell cytotoxicity and immunotherapy efficacy in cancer

## Geroscience

**IF 5.4**

 **Catalog No.** RHC82412  
**Product name** Anti-Human Phospho-Tau (pS202/pT205) Antibody (AT8)

Amyloid neuropathy, tauopathy, decreased cholinergic and dopaminergic neurons, long-term memory and motor deficits, and sleep disturbance in motopsin deficient mice
